Therefore, the goal should be to attempt  
removal of all visible disease (complete  
cytoreduction). The available surgical  
techniques have similarly evolved during  
the same period to achieve this goal and  
now include upper abdominal procedures,  
tumor ablation techniques, and radical  
pelvic surgery.

effort to minimize a potentially immunosuppressive tumor burden, palliate symptoms, and prevent complications<sup>223,224</sup> (Fig. 15.14).

## Cytoreductive Surgery - an overview | ScienceDirect Topics

Cytoreductive surgery, sometimes referred to as debulking, is a peritoneal mesothelioma treatment that aims to remove all visible tumor from the abdominal cavity. The surgery is often followed by HIPEC, a heated chemotherapy wash applied to the abdominal region to eliminate any remaining cancer cells. HIPEC Surgery Success Rate

## Cytoreductive Surgery with HIPEC | Treating Peritoneal ...

The Sugarbaker technique was developed by Paul Sugarbaker at the Washington Cancer Institute. It involves complete surgical tumour removal (also known as complete cytoreduction) combined with intraoperative heated chemotherapy, followed by postoperative intraperitoneal chemotherapy. The operation takes about 10 hours to complete and includes:
